***seNorge_2018* observational gridded datasets over Norway**

Cristian Lussana, Ole Einar Tveito, Ketil Tunheim and Andreas Dobler
Norwegian Meteorological Institute, Oslo, Norway

17 September 2019 - 5th Conference on Modelling Hydrology, Climate and Land Surface Processes, Lillehammer, Norway

The screenshot shows the article page for "seNorge_2018, daily precipitation and temperature datasets over Norway" in the journal Earth System Science Data. The page includes a navigation menu on the left with options like "About", "Editorial board", and "Articles". The main content area displays the article title, authors (Cristian Lussana, Ole Einar Tveito, Andreas Dobler, and Ketil Tunheim), and the submission date (05 Apr 2019). It also features a "Review status" box indicating the manuscript is a preprint and has been accepted for publication. A "Short summary" section provides a brief overview of the dataset. The page is published by Copernicus Publications.

Equitable Threat Score - All data

* analysis (CV)

ETS Equitable Threat Score

event definition:
precipitation gt/eq 1 mm/day

How well did the CV-analysis "yes" events correspond to the observed "yes" events (accounting for hits due to chance)?

How can spatial analysis help improving observational networks?

mean
temperature

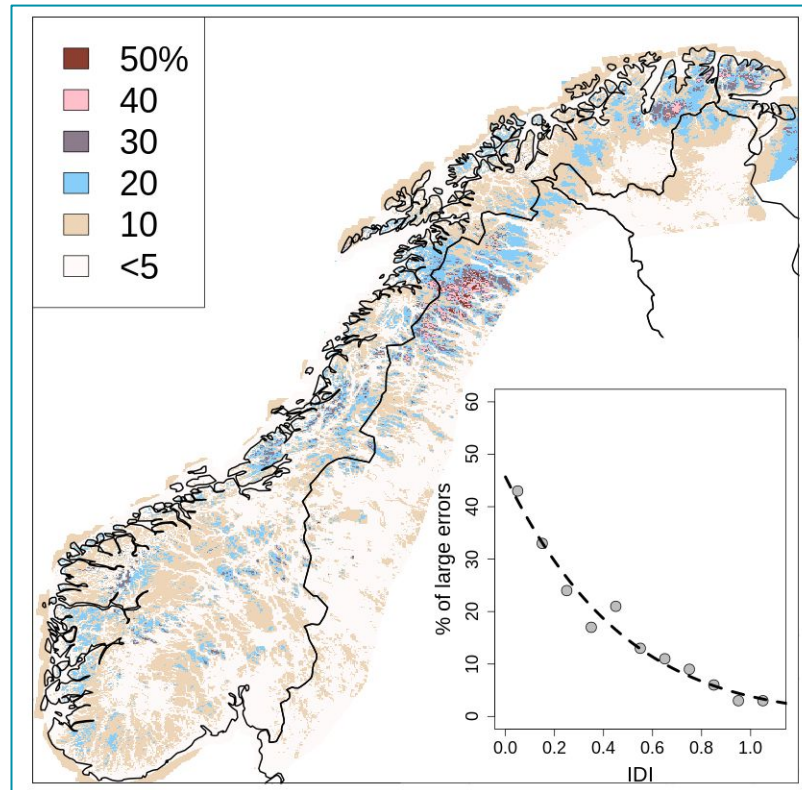

Fig. Probability of occurrence of large errors in daily mean temperature during winter.

large error: deviation of estimate from actual value larger than 3°C.

seNorge_2018, a step in the right direction

1. Spatial analysis. Scale separations. Locally stationary random fields.
 - a. *Optimal Interpolation / successive corrections / Data Influence.*
2. Precipitation not exclusively based on observations
 - a. *monthly fields from a numerical model.*
3. Temperature, quality depends on:
 - a. *the season of the year,*
 - b. *the station density and the terrain complexity,*
 - c. *minimum daily temperature is the most challenging variable.*
4. Precipitation, quality:
 - a. *the station density and the terrain complexity.*
